

College ERP Using MERN Stack

ABSTRACT

This paper is aimed at developing an Online College Management System that is of importance to the educational institute or college. This system is named CMS ERP using MERN stack. This system may be used to monitor college students. This application is being developed for an MCA student to maintain and facilitate ease of access to information. For this the users must be login with the system. CMS ERP is an Internet based application that aims at providing information to all levels of management within an organization. This system is used as an information managementsystem for the college. For a given student and staff (technical and non-technical) can access the system to either crud operation and access some information from the database.

Keywords: MERN, ERP, MongoDB

I. INTRODUCTION

The title of the project is “CMS ERP using MERN stack”. CMS ERP is defined as an application based on all levels of management providing information within an organization. This system can be used as an information management system for the college.

For a given student/staff (Technical / Non-technical) the Administrator creates a login id & password, usingthese students/ staff (Technical / Non-technical) can access the system to download some information from the database.

The front end will be a React+vite Based JavaScript application whereas the server will run on Node.js using Express.js. The database side of things will be

based on MongoDB whereas Mongoose will help Node.js communicate with the database.

II. PROBLEM DEFINITION

The existing system which we are using in our college is a traditional process and is a complete manual process. Now-a-days, education is playing a very significant role in society. Day-by-day, the percentage of illiterates are decreasing and the percentage of literates is increasing. Education will change society in all aspects and everyone wants to study higher professional degrees. Admissions are increasing day by day so the ratio of establishment of new colleges and schools are also increasing. But the actual challenge is starting from now. Most of the schools and colleges maintain student information in records.

When the number of records increased, it was difficult to maintain the information of each student in the old manual system. Maintaining the records manually leads to error prone and requires more manpower and it consumes more time for processing the records.

III. Aim and Objective

The main objective of developing the current project entitled “CMS ERP using MERN stack” is to build an effective system which is fast, accurate, consistent, reliable and flexible enough so that it can incorporate any future enhancements.

By automating the system using computers, sophisticated technology can be used for making the information more flexible, accurate, and secure and user friendly.

Time and manpower can be more effectively utilized and online information can be easily available to the user and at the same time we can maintain a higher level of security.

Every user such as student, staff and administration are able to see the information of each student online from anywhere and anytime.

IV. Literature Review

Until recently the place of the College Management System (CMS). Now-a-days, education is playing a very significant role in society. Day-by-day, the percentage of illiterates are decreasing and the percentage of literates is increasing. Education will change society in all aspects and everyone wants to study higher professional degrees.

Admissions are increasing day by day so there by. Ratio of establishment of new colleges and schools

are also increasing. But the actual challenge is starting from now. Most of the schools and colleges maintain student information in records.

When the number of records increased, it was difficult to maintain the information of each student in the old manual system.

Maintaining the records manually leads to error prone and requires more man power and it consumes more time for processing the records.

V. Requirement Analysis

Software Requirements

We need the following software to accomplish our project.

1. Writing Code (VS Code)
2. MERN Stack
 - a. MongoDB: A cross-platform document database.
 - b. Express: A back-end web application framework.
 - c. Reactjs: A JavaScript library for building user interfaces.
 - d. Node.js: A cross-platform JavaScript runtime environment.

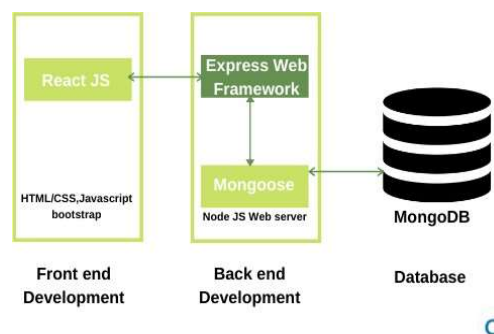

Figure 1. MERN stack

3. Web Browser for accessing the website.

Hardware Requirements

We will need the following hardware to accomplish our project.

1. Desktop or Laptop PC with Windows 10 64bit with 4GB Ram and at least 2GB of free space.
2. Android or iPhone that can run the latest version of web browsers like Chrome, Safari or Firefox.

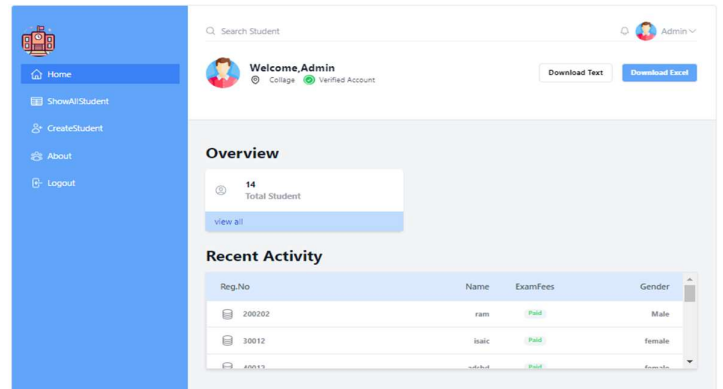

Figure 3. Admin Dashboard

These are the various modules available for the admin.

1. Student
2. Create Student
3. Delete student
4. View each student
5. Update or edit student
6. Download record (excel & plain text)

VI. Project Design and Modules

Login Page

Login Page will be used to authenticate various users that will be using the system.

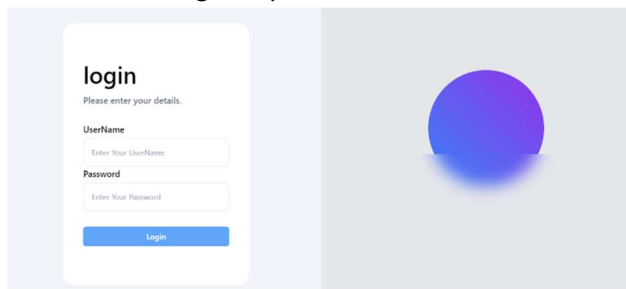

Figure 2. Login Page

RegNo	Name	ExamFees	Gender	Adm
200202	ram	Paid	Male	Yes
30012	Isak	Paid	female	Yes
40013	adibut	Paid	Female	Yes
50014	adibut	Paid	Female	Yes
60015	adibut	Paid	Female	Yes
70016	adibut	Paid	Female	Yes
80017	adibut	Paid	Female	Yes
90018	adibut	Paid	Female	Yes
10019	adibut	Paid	Female	Yes
11020	adibut	Paid	Female	Yes
12021	adibut	Paid	Female	Yes
13022	adibut	Paid	Female	Yes
14023	adibut	Paid	Female	Yes
15024	adibut	Paid	Female	Yes

Figure 4. Students Information

Admin Dashboard

This page will provide admin with the tool to manage all the students as well as CRUD operation.

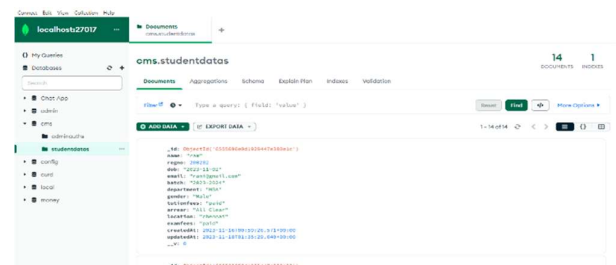

Figure 5. Mongoddb

VI. Technologies Used

HTML: The Hypertext Markup Language, or HTML is the standard markup language for documents designed to be displayed in a web browser. It can be assisted by technologies such as Cascading Style Sheets (CSS) and scripting languages such as JavaScript.

CSS: Cascading Style Sheets (CSS) is a style sheet language used for describing the presentation of a document written in a markup language such as HTML. CSS is designed to enable the separation of presentation and content, including layout, colors, and fonts. This separation can improve content accessibility, provide more flexibility and control in the specification of presentation characteristics, enable multiple web pages to share formatting by specifying the relevant CSS in a separate .css file which reduces complexity and repetition in the structural content as well as enabling the .css file to be cached to improve the page load speed between the pages that share the file and its formatting.

JavaScript: JavaScript is one of the core technologies of the World Wide Web. Over 97% of websites use it client-side for web page behavior, often incorporating third-party libraries. All major web browsers have a dedicated JavaScript engine to execute the code on the user's device.

As a multi-paradigm language, JavaScript supports event-driven, functional, and imperative programming styles. It has application programming interfaces (APIs) for working with text, dates, regular expressions, standard data structures, and the Document Object Model (DOM).

MERN stack: The MERN architecture allows you to easily construct a 3-tier architecture (frontend, backend, database) entirely using JavaScript and JSON.

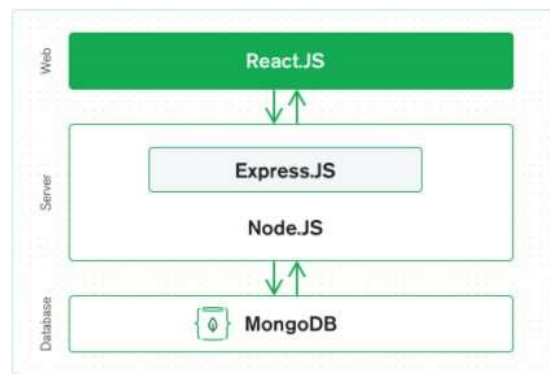

Figure 6. MERN Stack

React.js Front End

The top tier of the MERN stack is React.js, the declarative JavaScript framework for creating dynamic client-side applications in HTML. React lets you build up complex interfaces through simple Components, connect them to data on your backend server, and render them as HTML.

Express.js and Node.js Server Tier

The next level down is the Express.js server-side framework, running inside a Node.js server. Express.js bills itself as a “fast, unopinionated, minimalist web framework for Node.js,” and that is indeed exactly what it is. Express.js has powerful models for URL routing (matching an incoming URL with a server function), and handling HTTP requests and responses.

MongoDB Database Tier

If your application stores any data (user profiles, content, comments, uploads, events, etc.), then you're going to want a database that's just as easy to work with as React, Express, and Node.

That's where MongoDB comes in: JSON documents created in your React.js front end can be sent to the Express.js server, where they can be processed and (assuming they're valid) stored directly in MongoDB for later retrieval. Again, if you're building in the cloud, you'll want to look at Atlas. If you're looking to set up your own MERN stack, read on!

CONCLUSION

College ERP Management using MERN Stack provides an easy way to automate the functionalities of the college. It is an integrated platform that connects various departments of an institution like administration, staff, students. It provides reliability, time savings, and is easy to control. Information can be saved and can be accessed at any time by an authorized user.

VII.ACKNOWLEDGEMENT

Motivation and guidance are the keys towards success. I would like to extend my thanks to all the sources of motivation.

We would like to grab this opportunity to thank Mr. Pandian sir, HOD of MCA for encouragement and support has given for our project.

We are also thankful to all those who helped us directly or indirectly in completion of this work.
